**PROBLEM:**

Upper Ball Joint Failure

The OE upper control arm with integral ball joint utilizes a 1.062” ball joint stud and non-greaseable plastic design. This design has been prone to premature failure in as little as 36,000 miles.

**SOLUTION:**

MOOG® K80669/K80670 Premium Upper Control Arms

The MOOG® K80669/K80670 control arms feature an integral Problem Solver® ball joint with all-metal design for long life, patented MOOG domed cover plate for minimal axial and radial deflection, and grease fitting for lubrication and serviceability. Its 10% larger ball diameter of 1.180” (.118” larger than OEM) provides a larger ball surface to bearing area to withstand the rigors of light duty truck use. In addition, this long-lasting, one-piece, forged fine-grain steel control arm features preinstalled premium bushings, making it easier to install. Its precision design ensures proper alignment and restores OE ride control.
